

constructora

```
angleY = angleX = 0.0;  
modelHeight = 4; //alcada del model, depen d'aquest
```

initializeGL()

```
viewTransform();  
projectTransform();
```

projectTransform()

```
glm::mat4 Proj; // Matriu de projecció  
if (perspectiva)  
    Proj = glm::perspective(FOV, ra, radiEsc, 3.0f*radiEsc);  
else  
    Proj = glm::ortho(left, right, bottom, top, radiEsc, 3.0f*radiEsc);  
  
glUniformMatrix4fv (projLoc, 1, GL_FALSE, &Proj[0][0]);  
}
```

viewTransform()

```
glm::mat4 View; // Matriu de posició i orientació  
  
View = glm::translate(glm::mat4(1.f), glm::vec3(0, 0, -distancia)); //Allunyem camara  
View = glm::rotate(View, -angleX, glm::vec3(1, 0, 0));  
View = glm::rotate(View, -angleY, glm::vec3(0, 1, 0));  
View = glm::translate(View, -VRP); // Portem la camara al VRP  
  
glUniformMatrix4fv (viewLoc, 1, GL_FALSE, &View[0][0]);  
}
```

resizeGL()

```
void MyGLWidget::resizeGL (int width, int height){
    ra = (float)w/(float)h; // ra(v) = raw

    //Recalculem el FOV per tal que no es retalli quan raw<1
    if (width< height) {
        FOV = 2 * atan(tan(initFOV /2.f)/ra); //perspec
        bottom = -radiEsc / ra; //ortho
        top = radiEsc / ra; //ortho
    }
    if (width > height) {
        left = -radiEsc * ra; //ortho
        right = radiEsc * ra; //ortho
    }

    glViewport(0, 0, width, height);
    projectTransform();
}
```

Mouse

En el `void MyGLWidget::mouseMoveEvent(QMouseEvent *e)` afegir el calcul d angleX

```
angleX += (e->y() - yClick) * M_PI / 180.0;
```

.h

```
void maxSize();
void initCamera();

float initFOV, FOV, ra;
float left, right, top, bottom;
float distancia, maxHeight, modelHeight;

glm::vec3 VRP, sceneMax, sceneMin;

float angleX;
```

Noves funcions

```
void MyGLWidget::initCamera(){
    viewTransform();
    //Calcul de parametres inicials de camera perspectiva
    initFOV = FOV = 2.0*asin(radiEsc/distancia);
    ra = 1.f;

    //calcul de parametres inicials de camera ortogonal
    right = top = radiEsc;
    left = bottom = -radiEsc;

    projectTransform();
}

void MyGLWidget::maxSize() {
    //L'alçada del patricio max
    maxHeight = modelHeight;
    //Prenem 5 i -5 pqe son els maxims i els minim del terra (i de l'escena per tant)
    sceneMax = glm::vec3(5, maxHeight, 5);
    sceneMin = glm::vec3(-5, -1, -5); //alçada min = -1, que es on es situa el terra

    radiEsc = glm::distance(sceneMax,sceneMin) / 2;
    distancia = radiEsc*2.f;

    for (int i = 0; i < 3; ++i){
        VRP[i] = (sceneMax[i] + sceneMin[i])/2.0;
    }
}
```
